Project Documentation

Project: AI-Powered Lead Generation System

1. Project Overview

The AI-Powered Lead Generation System is a Salesforce-based solution designed to help businesses identify, manage, and prioritize potential customers (leads). The system uses Salesforce features and AI capabilities to analyze customer data and improve the efficiency of the sales process.

2. Project Features

The system includes the following key features:

- Lead data management and organization
- Custom objects, fields, and tabs creation
- Automation using Salesforce flows and validation rules
- Role and user management
- AI-based lead summary generation

3. Development Process

The project was developed using Salesforce configuration tools. The development process included requirement analysis, system design, object creation, field configuration, automation setup, and testing.

4. Testing and Validation

Testing was performed to ensure that all features work correctly. Validation rules and flows were tested to confirm that lead data is properly stored, processed, and managed within the system.

5. Expected Outcome

The final system helps businesses manage leads efficiently, improves decision-making for the sales team, and increases the chances of converting potential leads into successful customers.
